Atomicer

The easy way of producing sterile crushed ice for surgery.

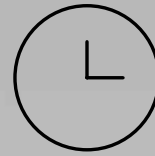

Load sterile block of ice.
Turn manual crank or use surgeon's drill.
Done!

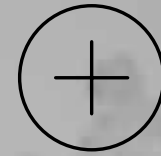

Easy handling

Highly efficient

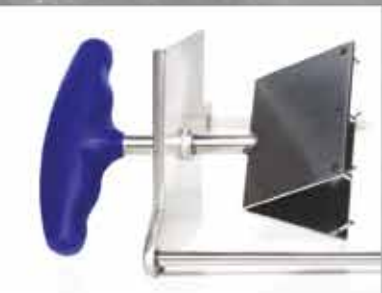

Homogeneous mass

The laser-crafted cutting unit requires only 35 seconds to create homogeneous crushed ice from a one liter block of ice. Easy by hand – for small quantities or fast by machine – for larger quantities.

With Atomicer you produce homogeneous crushed ice efficiently and with ease.

Achieve optimal transplant organ coverage with perfectly crushed sterile ice thanks to the ingenious milling unit.

Atomicer consists of three separable pieces. The ice block holder with attached handle and lid is one of these removable parts.

Various adapters for different drilling machines. The clamp ensures stable fixation of the Atomicer on any table.

The collector comfortably holds a half litre of sterile crushed ice.
